

No More Worms Slipping Away! The Hook for Heavy Cover

This is a hook that secures worms in place with cork screw worm keeper, specialized for heavy cover. It is designed so the snagless keel between the eyelet and nose touches the obstacle first, which will prevent worm's dislodging. The characteristic hook point is made longer to quickly spike through the upper mouth of the bass for a higher hooking ratio and little escaping of fish.

In the case of Offset Hook
For this part hit to an obstacle, the gap of the worm was off to the side.

In the case of PILEDIVER
When the lure passes through a cover, in the case of an offset hook, a worm slips off because the tip of the worm comes in contact with an obstacle previously. In the case of the pile driver, the worm does not slip off because a cover contact keel prevents the contact to the cover of the worm.

By the adoption of the corkscrew worm goalkeeper, a worm does not slip off and come off even if an angler lures into a complicated thicket densely.

The axis of the hook in the front guards the contact to the obstacle of the worm. This prevents from a worm being rolled up, and slipping off.

This strong wire does not lose in the strong fight of the big bass. So, an angler can use the strong and a little growth line with peace of mind.
This wide gap shape matches with the bulky worm. This is the convenient design which is usable to a worm of any kinds of size.
