

Terrific for Lure-Tuning

The Elastomer Material Adheres to the Body Curve

We took a new material, elastomer tungsten as a base of this weight, adding a special adhesive for under water use to make your lure-tuning a snap. The elastomer is so soft that it fits curves very well, while it rarely comes off the lure, no matter how roughly you use it. You can simply cut it up with scissors into desired sizes. It is ideal to suspend or tune fragile lures. It distributes weight on wider space better than lead. Being matte finish, the quieter presence will not pressure fish unnecessarily. It is now compatible with Feco products.
